SALMONELLA SURVEILLANCE SUMMARY

There were 1,515 human isolations of salmonellae during March, 1965 for an average of over 300 recoveries per week. The first quarter of 1965 demonstrated 1.6 percent fewer reported human recoveries than the same period last year. The difference can be attributed largely to the decline in incidence of *Salmonella derby* which during the first quarter of 1964 accounted for 804 recoveries as opposed to 175 for the same period this year.

The 7 most frequently reported serotypes during March were:

Rank	Serotype	Number	Percent
1	<i>S. typhi-murium</i> & <i>S. typhi-murium</i> var. <i>copenhagen</i>	466	30.8
2	<i>S. heidelberg</i>	110	7.3
